

微观经济学 (Microeconomics)

第七章 完全竞争市场 (Perfect Competition)

史晋川 教授

二〇一二年

§1 完全竞争市场的特征

1. 市场中买卖双方人数众多
2. 单个买（卖）者市场供给或需求的份额极小，单个厂商变动产量，无法影响市场价格，单个厂商是price taker(对应是 price setter)
3. 厂商能够自由进入和退出产业，即资源可以自由流入或流出产业部门
4. 市场中产品无差异
5. 买卖双方具有完备的市场信息

§2 厂商的收益 (Revenue curves)

1. 总收益 (TR)、平均收益 (AR) 和边际收益 (MR) 曲线

$$\textcircled{1} TR = PQ$$

$$\textcircled{2} AR = \frac{TR}{Q} = \frac{PQ}{Q} = P$$

$$\textcircled{3} MR = \frac{d(TR)}{dQ} \quad or \quad MR = \Delta TR = TR_n - TR_{n-1}$$

2. Perfect competition条件下AR、MR与dd'的关系

① AR and P

$$AR = P; AR = dd' \text{ (Demand Function)}$$

② AR and MR

$$MR = \frac{d(TR)}{dQ} = \frac{d(PQ)}{dQ} = P \frac{dQ}{dQ} + \frac{dP}{dQ} Q$$

$$MR = P(1 + \frac{dP}{dQ} \frac{Q}{P}) = P(1 - \frac{1}{|E_d|}) ; \quad |E_d| = \infty$$

$$\Rightarrow \frac{1}{|E_d|} = 0 \quad MR = P$$

Example $P = 2$ $TR = PQ = 2Q$

$$AR = \frac{TR}{Q} = \frac{PQ}{Q} = P = 2$$

$$MR = \frac{d(TR)}{dQ} = 2$$

$$MR = \Delta TC = TC_5 - TC_4 = 10 - 8 = 2$$

§3 厂商的短期均衡—利润 (π) 最大化

1. TC, TR, π 分析

$$(i) \ 0 < Q < Q_1, \ Q > Q_2 \ TR < TC \ \pi = (TR - TC) < 0$$

$$(ii) \ Q_1 < Q < Q_2, \ TR > TC \ \pi = (TR - TC) > 0$$

$$(iii) \ Q = Q_1, \ Q = Q_2 \ TR = TC \ \pi = (TR - TC) = 0$$

$$(iv) \ Q = Q_e, \ (TR - TC) = \pi \text{ (最大化)}$$

Math证明

$$\pi = TR - TC \Rightarrow \pi(Q) = TR(Q) - TC(Q)$$

$$M\pi = \frac{d\pi}{dQ} = \frac{d(TR)}{dQ} - \frac{d(TC)}{dQ} = 0$$

$$M\pi = MR - MC = 0$$

$$MR = MC$$

2. MR, MC, AR, AC分析

$$(i) 0 < Q < Q_b, Q > Q_c \quad AR < AC \quad \pi < 0$$

$$(ii) Q = Q_b, Q = Q_c \quad AR = AC \quad \pi = 0$$

$$(iii) Q_b < Q < Q_c \quad AR > AC \quad \pi > 0$$

$$(iv) Q = Q_e \quad AR > AC \text{ 且 } AR = MR = AC = P$$

$$\pi_{\max}(M\pi = MR - MC = 0, \text{ 且 } (M\pi)' < 0)$$

$$\textcircled{1} \quad Q_b < Q < Q_e \quad AR > AC \text{ but } MR > MC$$

$$Q \uparrow \quad M\pi = (MR - MC) \quad M\pi > 0 \quad \pi \uparrow \text{ing}$$

$$\textcircled{2} \quad Q_e < Q < Q_c \quad AR > AC \text{ but } MR < MC$$

$$Q \uparrow \quad M\pi = (MR - MC) \quad M\pi < 0 \quad \pi \downarrow \text{ing}$$

$$\pi_{\max} = PEF G = PEQ_e O - GFQ_e O$$

(TR) (TC)

$$(V) \quad Q = Q_a \quad MR - MC = 0 \quad MR = MC$$

$$AC > AR$$

$$\pi < 0$$

§4 厂商的短期均衡——亏损最小化

1. 亏损情形中的厂商均衡

$$(i) \quad Q = Q_e \quad MR = MC \quad M\pi = 0 \quad (M\pi)' < 0 \quad -\pi_{\min} \\ -\pi = PEQ_eO - GFQ_eO = PEF G_{\min}$$

$$(ii) \quad Q = Q_a \quad MR = MC \quad (M\pi)' > 0 \Rightarrow Q \uparrow \\ MR > MC \quad M\pi > 0 \quad -\pi \downarrow \text{ing}$$

(iii) $Q > Q_e$ (if $Q = Q_b$), $MR < MC$ $M\pi < 0 \Rightarrow Q \uparrow$, $-\pi \uparrow$ in g

(iv) $Q = Q_a$ $MR = MC$ $M\pi = 0$ but $(M\pi)' > 0 \Rightarrow Q \uparrow \rightarrow MR > MC$ $M\pi > 0$
 $-\pi \downarrow$ in g $Q = Q_a$ $-\pi_{\max}$

2. 厂商短期的供给曲线

$\pi = -\pi$ Firm 为何在 short-run 不退出生产或停产 (Shut down) ?

$$AC > AR (=p=MR) > AVC$$

$$AC = AFC + AVC; AC > AR > AVC$$

$$\text{停产} \quad \Rightarrow \pi > AFC$$

$$\text{生产} \quad \Rightarrow \pi < AFC \quad (\text{可弥补部分 FC})$$

$$Q = Q_e \quad AC = FQ_e \quad AVC = GQ_e$$

$$AFC = FG \quad FC = HFGI$$

$$\text{if shut down: } -\pi = TR - TC = PEQ_eO - HFGI = HFEP$$

$$HFEP < HFGI$$

$$\text{被弥补的亏损} = HFGI - HFEP = PEGI$$

§5 厂商的长期均衡

1. 收益曲线的变动

Revenue curve changes from short run to long run

① $\pi > 0$ in Long run

$\pi > 0 \rightarrow$ 新firms进入 \rightarrow 行业生产能力扩大 \rightarrow 行业产量和市场供应量增加 \rightarrow 产品的市场价格下降 $(Q_1 < Q_2, P_1 > P_2) \rightarrow$ 厂商所面临的 $AR (=MR=dd')$ 下降

② $\pi < 0$ in Long run

$\pi < 0 \rightarrow$ 原有 **Firms** 退出 \rightarrow 行业生产能力缩减 \rightarrow 行业产量和市场供应量下降 \rightarrow 产品市场价格上升 ($Q_1 > Q_2, P_1 < P_2$) \rightarrow 厂商所面临的 **AR(=MR=dd')** 上升

2. 长期均衡的条件

③ 条件分析:

- $MR=MC=AR=P=AC$
- Efficiency: Firm在LAC的最低点生产

②长期均衡与短期均衡比较

厂商均衡条件:

Short-run: $MR = MC = AR = P$, $AR \neq AC$

Long-run: $MR = MC = AR = P = AC$

厂商成本与利润:

Short-run: $AC > AC_{\min}$, $\pi > 0$

Long-run: $AC = AC_{\min}$, $\pi = 0$

厂商产量与价格:

*Long-run*时厂商产量低于*Short-run*厂商产量

*Long-run*时厂商价格低于*Short-run*厂商价格
